

2030

National standard curriculum of education will start to fully implement at elementary school since 2020 and junior high school 2021.

Its aim is society after 10 years.

Let's imagine the society of 2030.

So teachers must teach students to give academic skills that they can follow future society.

Last day TV shows the topic about motor company.

Mazda motor company has a planning about 10 years' future (2030) technology.

Mazda thinks that power unit of vehicle does not change significantly.

On 2030 that is

EV (Electric vehicle = using electric motor) 5%

Hybrid (using Fuel engine and electric motor) 95%

I agree this view or planning because of lack of charging system.

So drivers use EV, they must prepare chargers at each house and society prepares many charging stands.

So Mazda motor company keep study about good efficient fuel engine.

Now if student of yours want to be a vehicle engineer, how do you advise to them.

I think it is basic of vehicle, for example mechanics, electricity, chemistry, fuel and electric motor.

The study of following future is BASIC, I believe.
